Title: METAL-LIGAND COOPERATIVE CATALYSIS THROUGH N-H ARM DEPROTONATION/PyRIDINE DEAROMATIZATION FOR EFFICIENT HYDROGEN GENERATION FROM FORMIC ACID

Abstract: The invention describes phospho-amino pincer-type ligands, metal complexes thereof, and catalytic methods comprising such metal complexes.
DESCRIPTION

METAL-LIGAND COOPERATIVE CATALYSIS THROUGH N-H ARM DEPROTONATION/PYRIDINE DEAROMATIZATION FOR EFFICIENT HYDROGEN GENERATION FROM FORMIC ACID

CROSS REFERENCE TO RELATED APPLICATIONS

[001] This application claims priority to U.S. Provisional Application Serial No. 61/910,530, filed December 2, 2013, the contents of which are incorporated herein in their entirety for all purposes.

FIELD OF THE INVENTION

[002] The present invention relates generally to the field of chemistry and catalysis. More particularly, it relates to phospho-amino pincer-type ligands, metal complexes thereof, and catalytic methods comprising such metal complexes.

BACKGROUND OF THE INVENTION

[003] One of the most important challenges in the 21st century is energy. This involves the substantial transformation towards a clean energy system that meets our future needs without substantial damage to nature.\(^1,\)\(^2\) Hydrogen (H\(_2\)) is expected to play a crucial role as a secondary fuel and energy carrier in such a system.\(^3,\)\(^4\) H\(_2\) has a high gravimetric energy density of 33.3 kW·h/kg and it can be converted into energy in an internal combustion engine or fuel cells with the production of water (H\(_2\)O) as the only “byproduct”.\(^5\) However, it is believed that the hydrogen economy will not occur until significant technological advances in H\(_2\) production, storage and delivery systems are made.\(^6\) Among these issues, H\(_2\) storage has represented a great challenge. Conventional H\(_2\) storage in high-pressure compressed gas cylinders or cryogenic liquid tanks is straightforward, but it suffers from high energy input and low volumetric energy capacity.\(^7\) Alternative approaches through physical adsorption of H\(_2\) in high-surface-area materials, such as metal-organic frameworks, zeolites, nanostructured carbon materials, etc., experience the limitation of temperature and pressure ranges.\(^8-\)\(^10\) While chemical hydride systems have high gravimetric H\(_2\) capacities up to 20 wt\%, the low reversibility prohibits their widespread applications.\(^11-\)\(^13\) In this regard, formic acid (FA) becomes an attractive choice. Although FA contains only 4.35 wt% of H\(_2\), because of its high density of 1.22 g/cm\(^3\), its volumetric capacity reaches 53.0 g H\(_2\)/L. This is equivalent to an energy density of 1.77 kW·h/L, suitable for automotive and mobile applications. A carbon
neutral system for H₂ storage can be created when efficient hydrogenation of carbon dioxide (CO₂) to FA/formates and selective dehydrogenation of FA are developed.¹⁴⁻¹⁷

[004] The decomposition of FA to H₂ and CO₂ is thermodynamically favored, but the energy barrier is high and the selectivity is low (for the formation of H₂O and CO) in the absence of a suitable catalyst. After the potential of utilizing CO₂ as a H₂ storage material was recognized,¹⁸,¹⁹ a number of homogeneous and heterogeneous catalyst systems have been developed recently for the generation of H₂ from FA.²⁰⁻⁴³ Reactions give significantly enhanced turnover frequencies (TOFs) and turnover numbers (TONs) by using FA/NEt₃ azeotrope or FA/formate mixtures at the cost of decreasing the overall volumetric H₂ capacity. Only a few molecular catalysts show good activities in the absence of base additives.²⁵,³²,⁴³

[005] Therefore, a need exists for the development of novel catalyst systems that overcome one or more of the current disadvantages noted above.

**BRIEF SUMMARY OF THE INVENTION**

[006] In one aspect, PN³⁺-pincer ligands are provided, with corresponding intermediates, and metal complexes thereof. These PN³⁺-pincer complexes have been found to convert formic acid to hydrogen and carbon dioxide, substantially without generation of carbon monoxide, more particularly without any detectable carbon monoxide, indicating that the purity of the regenerated gas is suitable for use in hydrogen fuel cells. Conversion of formic acid to hydrogen and carbon dioxide was effected under mild reaction conditions. In some aspects, the reactions were performed under base-free conditions. Additionally, the catalyst systems described herein can be used for the hydrogenation of carbon dioxide to formate or formic acid.

[007] In one aspect, the present disclosure provides phospho-amino ligands and methods which include the use of the ligands and their complexes described herein to produce hydrogen from formic acid. The method includes the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:
wherein R₁ and R₂, are each independently alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;
R₃, and R₄, if present, are each independently alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), amino, hydroxyl, alkoxyl or a substituted version of any of these groups;
each Z, independently, is CR₆, N or P;
R₆ is a hydrogen atom or an alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), amino, hydroxyl, alkoxyl or a substituted version of any of these groups;
T is a N, NR₇, CR₈, or CR₉R₁₀;
R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;
Q is P or N;
optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, one or both of R₃ and/or R₄ are not present; and
-------- designates a single bond or a double bond.

[008] In another aspect, the method includes the step of contacting formic acid with a complex comprising formula (II):
wherein $R_1$, $R_2$, $R_3$, $R_4$, $R_5$, $Z$, $R_6$, $T$, $R_7$, $R_8$, $R_9$, $R_{10}$, $Q$ and ——— are as defined above, $M$ is a metal or metal ion that is a group 8 metal or metal ion, $L$ is a neutral or an anionic ligand, “$n$” is 0, 1 or 2 and $X$ is a halide or a hydrogen atom.

5 **[009]** In still another aspect, the method includes the step of contacting formic acid with a complex comprising formula (III):

wherein $R_1$, $R_2$, $R_3$, $R_4$, $R_5$, $Z$, $R_6$, $T$, $R_7$, $R_8$, $R_9$, $R_{10}$, $Q$, and ———, $L$, $n$, $M$ and $X$ are as defined above.

10 **[010]** In still another aspect, the method includes the step of contacting formic acid with a complex comprising formula (IV):
wherein R₁, R₂, R₃, R₄, R₅, Z, R₆, are as defined above.

[011] In another aspect, the method includes the step of contacting formic acid with a complex comprising formula (V):

wherein R₁, R₂, R₃, R₄, R₅, Z, R₆, M, L, n and X are as defined above.

[012] In yet another aspect, the method includes the step of contacting formic acid with a complex comprising formula (VI):

wherein R₁, R₂, R₃, R₄, R₅, Z, R₆, M, L, n and X are as defined above.
[013] In certain aspects for formulae (II), (III), (V) and (VI), X is H and L is CO (carbon monoxide) or vice versa.

[014] In other aspects for formulae (II), (III), (V) and (VI), X and L cannot both be CO (carbon monoxide) or hydrogen. In other aspects, both X and L are hydrogen. In still other aspects, both X and L are CO.

[015] While multiple embodiments are disclosed, still other embodiments of the present invention will become apparent to those skilled in the art from the following detailed description. As will be apparent, the invention is capable of modifications in various obvious aspects, all without departing from the spirit and scope of the present invention. Accordingly, the detailed descriptions are to be regarded as illustrative in nature and not restrictive.

DETAILED DESCRIPTION

[016] In certain aspects of the present invention, there are provided a new class of pincer-type ligands, including those having a disubstituted-phosphinoamino (NH-PR$_2$) arm. Metal complexes of such ligands are also provided, including complexes that may be used as catalysts for a variety of transformations, including conversion of formic acid to carbon dioxide and hydrogen or hydrogenation of carbon dioxide to form a formate or formic acid. Upon complexation of ligands described herein to a transition metal and treatment of a base, in some embodiments, the resulting complex can undergo dearomatization after the elimination of H-X.

\end{align*}
\]

wherein T, Q and Z are as described herein.

[017] In one aspect, the present disclosure provides phospho-amino ligands and methods which include the use of the ligands and their complexes described herein to produce hydrogen from formic acid. The method includes the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:
wherein R₁ and R₂, are each independently alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), or a substituted version of any of these groups;
R₃ and R₄, if present, are each independently alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;
each Z, independently, is CR₂, N or P;
R₆ is a hydrogen atom or an alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;
T is a N, NR₇, CR₉, or CR₉R₁₀;
R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), or a substituted version of any of these groups;
Q is P or N;
optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl₉(C₁₂), aryl₉(C₁₂), aralkyl₉(C₁₂), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R₃ and R₄ are not present; and
------ designates a single bond or a double bond.

[018] In another aspect, the method includes the step of contacting formic acid with a complex comprising formula (II):
wherein $R_1$, $R_2$, $R_3$, $R_4$, $R_5$, $Z$, $R_6$, $T$, $R_7$, $R_8$, $R_9$, $R_{10}$, $Q$ and $\ldots\ldots\ldots\ldots$ are as defined above, M is a metal or metal ion that is a group 8 metal or metal ion, L is a neutral or an anionic ligand, "n" is 0, 1 or 2 and X is a halide or a hydrogen atom.

5 [019] In still another aspect, the method includes the step of contacting formic acid with a complex comprising formula (III):

wherein $R_1$, $R_2$, $R_3$, $R_4$, $R_5$, $Z$, $R_6$, $T$, $R_7$, $R_8$, $R_9$, $R_{10}$, $Q$, and $\ldots\ldots\ldots\ldots$, L, n, M and X are as defined above.

10 [020] In still another aspect, the method includes the step of contacting formic acid with a complex comprising formula (IV):
wherein \( R_1, R_2, R_3, R_4, R_5, Z, R_6 \) are as defined above.

[021] In another aspect, the method includes the step of contacting formic acid with a complex comprising formula (V):

![Diagram V](image)

wherein \( R_1, R_2, R_3, R_4, R_5, Z, R_6, M, L, n \) and \( X \) are as defined above.

[022] In yet another aspect, the method includes the step of contacting formic acid with a complex comprising formula (VI):

![Diagram VI](image)

wherein \( R_1, R_2, R_3, R_4, R_5, Z, R_6, M, L, n \) and \( X \) are as defined above.
In certain aspects for formulae (II), (III), (V) and (VI), X is a hydride (H) or CO and L is CO (carbon monoxide) or H.

In other aspects for formulae (II), (III), (V) and (VI), X and L cannot both be CO (carbon monoxide) or hydrogen.

M is a transition metal or a transition metal ion including iron (Fe), ruthenium (Ru), Osmium (Os) and hassium (Hs).

L is a neutral or anionic ligand, such as carbon monoxide (C), phosphine, CN, a hydride, H-BH₃, or a halide.

Halides, as noted herein, include, for example, chloride, bromide, iodide, or fluoride.

It should be understood that the dative bonds depicted with metal or metal ion “M” can be covalent, ionic, van der Waals type interactions, complexation interactions or other types of interactions where the metal (M). It should be understood that there is an association with the metal or metal ion and one or more of the nitrogen of the pyridine ring, the deaoromatized N of the pyridine ring, a “P”, a “T”, an NH, an imine nitrogen, or “Q” of the ligands described herein. The stereochemistry of the “L” and or halide “X” associated with the metal or metal ion “M” is not limited to a planar structure but is merely depicted this way for convenience.

Selected structures include, for example, PN₃-pincer ruthenium (Ru) complexes C1 through C3, which are useful for dehydrogenation of formic acid are depicted below. Further details regarding different embodiments are provided throughout this disclosure.
Phospho-Amino Pincer-Type Ligands

In one aspect, the disclosure provides compounds of formula (IV)

\[
\begin{align*}
\text{wherein } R_1, R_2, R_3, \text{ and } R_4 \text{ are each independently alkyl}_{(C\leq12)}, \text{ aryl}_{(C\leq12)}, \text{ aralkyl}_{(C\leq12)}, \text{ or a substituted version of any of these groups;}

R_5 \text{ is a hydrogen atom or an alkyl}_{(C\leq12)}, \text{ aryl}_{(C\leq12)}, \text{ or a substituted version of any of these groups;}

\text{each } Z, \text{ independently, is } \text{CR}_6, \text{ N or P;}

R_6 \text{ is a hydrogen atom or an alkyl}_{(C\leq12)}, \text{ aryl}_{(C\leq12)}, \text{ aralkyl}_{(C\leq12)}, \text{ amino, hydroxyl, alkoxy or a substituted version of any of these groups; and}

Z \text{ is not N and when } R_1, R_2, R_3, \text{ and } R_4 \text{ are phenyl, } R_5 \text{ is not a hydrogen atom and each } Z \text{ is not CH.}
\end{align*}
\]

These methods can be further modified and optimized using the principles and techniques of organic chemistry as applied by a person skilled in the art. Such principles and techniques are taught, for example, in March’s *Advanced Organic Chemistry: Reactions, Mechanisms, and Structure* (2007), which is incorporated by reference herein. The above
methods can be further modified and optimized for preparative, pilot- or large-scale production, either batch of continuous, using the principles and techniques of process chemistry as applied by a person skilled in the art. Such principles and techniques are taught, for example, in Practical Process Research & Development (2000), which is incorporated by reference herein.

**Phospho-Amino, Pincer-Type Ligand Complexes and Methods of Use**

[029] The present disclosure also provides metal complexes of this novel class of ligands. Such complexes may be used to facilitate a variety of organic transformations, including conversion of formic acid to hydrogen and carbon dioxide and or hydrogenation of carbon dioxide to form a formate or formic acid.

[030] For example, ruthenium complexes of ligands can be made, and optionally deprotonated, to provide a dearomatized pyridine moiety and an imine arm. Ruthenium complexes of ligands C1, C2 and C3 can catalyze, for example, the conversion of formic acid to hydrogen and carbon dioxide (without any generation of carbon monoxide) (Tables 1, 2 and 3) and hydrogenation of carbon dioxide to formate (Table 4).

[031] The above methods can be further modified and optimized for preparative, pilot- or large-scale production, either batch of continuous, using the principles and techniques of process chemistry as applied by a person skilled in the art. Such principles and techniques are taught, for example, in Practical Process Research & Development (2000), which is incorporated by reference herein.

**Definitions**

[032] When used in the context of a chemical group, “hydrogen” means −H; “hydroxy” means −OH; “oxo” means =O; “halo” means independently −F, −Cl, −Br or −I; “amino” means −NH2 (see below for definitions of groups containing the term amino, e.g., alkylamino); “hydroxyamino” means −NHOH; “nitro” means −NO2; imino means =NH (see below for definitions of groups containing the term imino, e.g., alkylamino); “cyano” means −CN; “isocyanate” means −N=C=O; “azido” means −N3; in a monovalent context “phosphate” means −OP(O)(OH)2 or a deprotonated form thereof; in a divalent context “phosphate” means −OP(O)(OH)O− or a deprotonated form thereof; “mercapto” means −SH; “thio” means =S; “thioether” means −S−; “sulfonamido” means −NHS(O)2− (see below for definitions of groups containing the term sulfonamido, e.g., alkylsulfonamido); “sulfonyl” means −S(O)2− (see below for definitions of groups containing the term sulfonyl, e.g.,
alkylsulfonyl); and “sulfinyl” means $-\text{S(O)}-$ (see below for definitions of groups containing the term sulfinyl, e.g., alkylsulfinyl).

[033] In the context of chemical formulas, the symbol “$-$” means a single bond, “$\equiv$” means a double bond, and “$\cong$” means triple bond. The symbol “$\begin{array}{c} --- \\ | \end{array}$” represents an optional bond, which if present is either single or double. The symbol “$\begin{array}{c} ---- \end{array}$” represents a single bond or a double bond. Thus, for example, the structure $\begin{array}{c} \circ \end{array}$ includes the structures $\begin{array}{c} \circ \end{array}$, $\begin{array}{c} \circ \end{array}$, $\begin{array}{c} \circ \end{array}$, and $\begin{array}{c} \circ \end{array}$. As will be understood by a person of skill in the art, no one such ring atom forms part of more than one double bond. The symbol “$\begin{array}{c} \begin{array}{c} \circ \end{array} \begin{array}{c} \circ \end{array} \end{array}$”, when drawn perpendicularly across a bond indicates a point of attachment of the group. It is noted that the point of attachment is typically only identified in this manner for larger groups in order to assist the reader in rapidly and unambiguously identifying a point of attachment. The symbol “$\begin{array}{c} \begin{array}{c} \circ \end{array} \end{array}$” means a single bond where the group attached to the thick end of the wedge is “out of the page.” The symbol “$\begin{array}{c} \begin{array}{c} \circ \end{array} \end{array}$” means a single bond where the group attached to the thick end of the wedge is “into the page”. The symbol “$\begin{array}{c} \begin{array}{c} \circ \end{array} \end{array}$” means a single bond where the conformation (e.g., either R or S) or the geometry is undefined (e.g., either E or Z).

[034] Any undefined valency on an atom of a structure shown in this application implicitly represents a hydrogen atom bonded to the atom. When a group “R” is depicted as a “floating group” on a ring system, for example, in the formula:

$\begin{array}{c} \text{R} \\ \begin{array}{c} \text{X} \\ \text{Y} \end{array} \end{array}$,

then R may replace any hydrogen atom attached to any of the ring atoms, including a depicted, implied, or expressly defined hydrogen, so long as a stable structure is formed. When a group “R” is depicted as a “floating group” on a fused ring system, as for example in the formula:

$\begin{array}{c} \text{R}_x \\ \begin{array}{c} \text{X} \\ \text{Y} \end{array} \end{array}$,

then R may replace any hydrogen attached to any of the ring atoms of either of the fused rings unless specified otherwise. Replaceable hydrogens include depicted hydrogens (e.g., the hydrogen attached to the nitrogen in the formula above), implied hydrogens (e.g., a
hydrogen of the formula above that is not shown but understood to be present), expressly
defined hydrogens, and optional hydrogens whose presence depends on the identity of a ring
atom (e.g., a hydrogen attached to group X, when X equals –CH–), so long as a stable
structure is formed. In the example depicted, R may reside on either the 5-membered or the 6-
membered ring of the fused ring system. In the formula above, the subscript letter “y”
immediately following the group “R” enclosed in parentheses, represents a numeric variable.
Unless specified otherwise, this variable can be 0, 1, 2, or any integer greater than 2, only
limited by the maximum number of replaceable hydrogen atoms of the ring or ring system.
For the groups and classes below, the following parenthetical subscripts further define the
group/class as follows: “(Cn)” defines the exact number (n) of carbon atoms in the
group/class. “(C≤n)” defines the maximum number (n) of carbon atoms that can be in the
group/class, with the minimum number as small as possible for the group in question, e.g., it
is understood that the minimum number of carbon atoms in the group “alkenyl(C≤8)” or the
class “alkene(C≥8)” is two. For example, “alkoxy(C≤10)” designates those alkoxy groups having
from 1 to 10 carbon atoms (e.g., 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10, or any range derivable therein
(e.g., 3 to 10 carbon atoms). (Cn-n’) defines both the minimum (n) and maximum number
(n’) of carbon atoms in the group. Similarly, “alkyl(C2–10)” designates those alkyl groups
having from 2 to 10 carbon atoms (e.g., 2, 3, 4, 5, 6, 7, 8, 9, or 10, or any range derivable
therein (e.g., 3 to 10 carbon atoms)).

[035] The term “saturated” as used herein means the compound or group so modified has no
carbon-carbon double and no carbon-carbon triple bonds, except as noted below. The term
does not preclude carbon-heteroatom multiple bonds, for example a carbon oxygen double
bond or a carbon nitrogen double bond. Moreover, it does not preclude a carbon-carbon
double bond that may occur as part of keto-enol tautomerism or imine/enamine tautomerism.

[036] The term “aliphatic” when used without the “substituted” modifier signifies that the
compound/group so modified is an acyclic or cyclic, but non-aromatic hydrocarbon
compound or group. In aliphatic compounds/groups, the carbon atoms can be joined together
in straight chains, branched chains, or non-aromatic rings (acyclic). Aliphatic
compounds/groups can be saturated, that is joined by single bonds (alkanes/alkyl), or
unsaturated, with one or more double bonds (alkenes/alkenyl) or with one or more triple
bonds (alkynes/alkynyl). When the term “aliphatic” is used without the “substituted”
modifier only carbon and hydrogen atoms are present. When the term is used with the
“substituted” modifier one or more hydrogen atom has been independently replaced by –OH,
−F, −Cl, −Br, −I, −NH₂, −NO₂, −CO₂H, −CO₂CH₃, −CN, −SH, −OCH₃, −OCH₂CH₃, −C(O)CH₃, −N(CH₃)₂, −C(O)NH₂ or −OC(O)CH₃.

[037] The term “alkyl” when used without the “substituted” modifier refers to a monovalent saturated aliphatic group with a carbon atom as the point of attachment, a linear or branched, cyclo, cyclic or acyclic structure, and no atoms other than carbon and hydrogen. Thus, as used herein cycloalkyl is a subset of alkyl. The groups −CH₃ (Me), −CH₂CH₃ (Et), −CH₂CH₂CH₃ (n-Pr), −CH(CH₃)₂ (iso-Pr), −CH(CH₂CH₃) (cyclopropyl), −CH₂CH₂CH₂CH₃ (n-Bu), −CH(CH₃)CH₂CH₃ (sec-butyl), −CH₂CH(CH₃)₂ (iso-butyl), −C(CH₃)₃ (tert-butyl), −CH₂C(CH₃)₂ (neo-pentyl), cyclobutyl, cyclopentyl, cyclohexyl, and cyclohexylmethyl are non-limiting examples of alkyl groups. The term “alkanediyl” when used without the “substituted” modifier refers to a divalent saturated aliphatic group, with one or two saturated carbon atom(s) as the point(s) of attachment, a linear or branched, cyclo, cyclic or acyclic structure, no carbon-carbon double or triple bonds, and no atoms other than carbon and hydrogen. The groups, −CH₂− (methylene), −CH₂CH₂−, −CH₂C(CH₃)₂CH₂−, −CH₂CH₂CH₂−, and , are non-limiting examples of alkanediyl groups. The term “alkylidene” when used without the “substituted” modifier refers to the divalent group =CRR′ in which R and R′ are independently hydrogen, alkyl, or R and R′ are taken together to represent an alkanediyl having at least two carbon atoms. Non-limiting examples of alkylidene groups include: =CH₂, =CH(CH₂CH₃), and =C(CH₃)₂. When any of these terms is used with the “substituted” modifier one or more hydrogen atom has been independently replaced by −OH, −F, −Cl, −Br, −I, −NH₂, −NO₂, −CO₂H, −CO₂CH₃, −CN, −SH, −OCH₃, −OCH₂CH₃, −C(O)CH₃, −N(CH₃)₂, −C(O)NH₂ or −OC(O)CH₃. The following groups are non-limiting examples of substituted alkyl groups: −CH₂OH, −CH₂Cl, −CF₃, −CH₂CN, −CH₂C(O)OH, −CH₂C(O)OCH₃, −CH₂C(O)NH₂, −CH₂C(O)CH₃, −CH₂OCH₃, −CH₂OC(O)CH₃, −CH₂NH₂, −CH₂N(CH₃)₂, and −CH₂CH₂Cl. The term “fluoroalkyl” is a subset of substituted alkyl, in which one or more hydrogen has been substituted with a fluoro group and no other atoms aside from carbon, hydrogen and fluorine are present. The groups, −CH₂F, −CF₃, and −CH₂CF₃ are non-limiting examples of fluoroalkyl groups. An “alkane” refers to the compound H–R, wherein R is alkyl.

[038] The term “alkenyl” when used without the “substituted” modifier refers to a monovalent unsaturated aliphatic group with a carbon atom as the point of attachment, a linear or branched, cyclo, cyclic or acyclic structure, at least one nonaromatic carbon-carbon double bond, no carbon-carbon triple bonds, and no atoms other than carbon and hydrogen.
Non-limiting examples of alkenyl groups include: −CH=CH₂ (vinyl), −CH=CHCH₃,
−CH=CHCH₂CH₃, −CH₂CH=CH₂ (allyl), −CH₂CH=CHCH₃, and −CH=CH−C₆H₅. The term
“alkenediyl” when used without the “substituted” modifier refers to a divalent unsaturated
aliphatic group, with two carbon atoms as points of attachment, a linear or branched, cyclo,
cyclic or acyclic structure, at least one nonaromatic carbon-carbon double bond, no carbon-
carbon triple bonds, and no atoms other than carbon and hydrogen. The groups, −CH=CH−,
−CH=C(CH₃)CH₂−, −CH=CHCH₂−, and the other are non-limiting examples of
alkenediyl groups. When these terms are used with the “substituted” modifier one or more
hydrogen atom has been independently replaced by −OH, −F, −Cl, −Br, −I, −NH₂, −NO₂,
−CO₂H, −CO₂CH₃, −CN, −SH, −OCH₃, −OCH₂CH₃, −C(O)CH₃, −N(CH₃)₂, −C(O)NH₂ or −
OC(O)CH₃. The groups, −CH=CHF, −CH=CHCl and −CH=CHBr, are non-limiting
examples of substituted alkenyl groups. An “alkene” refers to the compound H−R, wherein
R is alkenyl.

[039] The term “alkynyl” when used without the “substituted” modifier refers to an
monovalent unsaturated aliphatic group with a carbon atom as the point of attachment, a
linear or branched, cyclo, cyclic or acyclic structure, at least one carbon-carbon triple bond,
and no atoms other than carbon and hydrogen. As used herein, the term alkynyl does not
preclude the presence of one or more non-aromatic carbon-carbon double bonds. The groups,
−C≡CH, −C≡CCH₃, and −CH₂C≡CCH₃, are non-limiting examples of alkynyl groups. The
term “alkynediyl” when used without the “substituted” modifier refers to a divalent
unsaturated aliphatic group, with two carbon atoms as points of attachment, a linear or
branched, cyclo, cyclic or acyclic structure, at least one carbon-carbon triple bond, and no
atoms other than carbon and hydrogen. When these terms are used with the “substituted”
modifier one or more hydrogen atom has been independently replaced by −OH, −F, −Cl, −Br,
−I, −NH₂, −NO₂, −CO₂H, −CO₂CH₃, −CN, −SH, −OCH₃, −OCH₂CH₃, −C(O)CH₃,
−N(CH₃)₂, −C(O)NH₂ or −OC(O)CH₃. An “alkyne” refers to the compound H−R, wherein R
is alkynyl.

[040] The term “aryl” when used without the “substituted” modifier refers to a monovalent
unsaturated aromatic group with an aromatic carbon atom as the point of attachment, said
carbon atom forming part of a one or more six-membered aromatic ring structure, wherein
the ring atoms are all carbon, and wherein the group consists of no atoms other than carbon
and hydrogen. If more than one ring is present, the rings may be fused or not fused. As used
herein, the term does not preclude the presence of one or more alkyl group (carbon number
limitation permitting) attached to the first aromatic ring or any additional aromatic ring present. Non-limiting examples of aryl groups include phenyl (Ph), methylphenyl, (dimethyl)phenyl, \(-C_6H_4CH_2CH_3\) (ethylphenyl), naphthyl, and the monovalent group derived from biphenyl. The term “arenediyl” when used without the “substituted” modifier refers to a divalent aromatic group, with two aromatic carbon atoms as points of attachment, said carbon atoms forming part of one or more six-membered aromatic ring structure(s) wherein the ring atoms are all carbon, and wherein the monovalent group consists of no atoms other than carbon and hydrogen. As used herein, the term does not preclude the presence of one or more alkyl group (carbon number limitation permitting) attached to the first aromatic ring or any additional aromatic ring present. If more than one ring is present, the rings may be fused or unfused. Non-limiting examples of arenediyl groups include:

\[
\text{\includegraphics[width=\textwidth]{arenediyl-groups.png}}
\]

**[041]** When these terms are used with the “substituted” modifier one or more hydrogen atom has been independently replaced by \(-\text{OH}, -\text{F}, -\text{Cl}, -\text{Br}, -\text{I}, -\text{NH}_2, -\text{NO}_2, -\text{CO}_2\text{H}, -\text{CO}_2\text{CH}_3, -\text{CN}, -\text{SH}, -\text{OCH}_3, -\text{OCH}_2\text{CH}_3, -\text{C(}\text{O}\text{)CH}_3, -\text{N(}\text{CH}_3)_2, -\text{C(}\text{O}\text{)NH}_2 \text{ or } -\text{OC(}\text{O}\text{)CH}_3.\)** An “arene” refers to the compound \(\text{H-R},\) wherein \(R\) is aryl.

**[042]** The term “aralkyl” when used without the “substituted” modifier refers to the monovalent group \(-\text{alkanediyl-aryl},\) in which the terms alkanediyl and aryl are each used in a manner consistent with the definitions provided above. Non-limiting examples of aralkyls are: phenylmethyl (benzyl, \(\text{Bn}\)) and 2-phenyl-ethyl. When the term is used with the “substituted” modifier one or more hydrogen atom from the alkanediyl and/or the aryl has been independently replaced by \(-\text{OH}, -\text{F}, -\text{Cl}, -\text{Br}, -\text{I}, -\text{NH}_2, -\text{NO}_2, -\text{CO}_2\text{H}, -\text{CO}_2\text{CH}_3, -\text{CN}, -\text{SH}, -\text{OCH}_3, -\text{OCH}_2\text{CH}_3, -\text{C(}\text{O}\text{)CH}_3, -\text{N(}\text{CH}_3)_2, -\text{C(}\text{O}\text{)NH}_2 \text{ or } -\text{OC(}\text{O}\text{)CH}_3.\)** Non-limiting examples of substituted aralkyls are: (3-chlorophenyl)-methyl, and 2-chloro-2-phenyl-ethyl-1-yl.

**[043]** The term “heteroaryl” when used without the “substituted” modifier refers to a monovalent aromatic group with an aromatic carbon atom or nitrogen atom as the point of attachment, said carbon atom or nitrogen atom forming part of an aromatic ring structure wherein at least one of the ring atoms is nitrogen, oxygen or sulfur, and wherein the group consists of no atoms other than carbon, hydrogen, aromatic nitrogen, aromatic oxygen and aromatic sulfur. As used herein, the term does not preclude the presence of one or more alkyl group (carbon number limitation permitting) attached to the aromatic ring or any additional
aromatic ring present. Non-limiting examples of heteroaryl groups include furanyl, imidazolyl, indolyl, indazolyl (Im), methylpyridyl, oxazolyl, pyridyl, pyrrolyl, pyrimidyl, pyrazinyl, quinolyl, quinazolyl, quinoxalinyl, thienyl, and triazinyl. The term “heteroarenediy1” when used without the “substituted” modifier refers to an divalent aromatic group, with two aromatic carbon atoms, two aromatic nitrogen atoms, or one aromatic carbon atom and one aromatic nitrogen atom as the two points of attachment, said atoms forming part of one or more aromatic ring structure(s) wherein at least one of the ring atoms is nitrogen, oxygen or sulfur, and wherein the divalent group consists of no atoms other than carbon, hydrogen, aromatic nitrogen, aromatic oxygen and aromatic sulfur. As used herein, the term does not preclude the presence of one or more alkyl group (carbon number limitation permitting) attached to the first aromatic ring or any additional aromatic ring present. If more than one ring is present, the rings may be fused or unfused. Non-limiting examples of heteroarenediy1 groups include:

\[ \text{[044]} \] When these terms are used with the “substituted” modifier one or more hydrogen atom has been independently replaced by –OH, –F, –Cl, –Br, –I, –NH₂, –NO₂, –CO₂H, –CO₂CH₃, –CN, –SH, –OCH₃, –OCH₂CH₃, –C(O)CH₃, –N(CH₃)₂, –C(O)NH₂ or –OC(O)CH₃.

\[ \text{[045]} \] The term “acyl” when used without the “substituted” modifier refers to the group –C(O)R, in which R is a hydrogen, alkyl, aryl, aralkyl or heteroaryl, as those terms are defined above. The groups, –CHO, –C(O)CH₃ (acetyl), Ac, –C(O)CH₂CH₃, –C(O)CH₂CH₂CH₃, –C(O)CH(CH₃)₂, –C(O)CH₂CH(CH₂)₂, –C(O)C₆H₅, –C(O)C₆H₄CH₃, –C(O)CH₂C₆H₅, –C(O)(imidazolyl) are non-limiting examples of acyl groups. A “thioacyl” is defined in an analogous manner, except that the oxygen atom of the group –C(O)R has been replaced with a sulfur atom, –C(S)R. When either of these terms are used with the “substituted” modifier one or more hydrogen atom has been independently replaced by –OH, –F, –Cl, –Br, –I, –NH₂, –NO₂, –CO₂H, –CO₂CH₃, –CN, –SH, –OCH₃, –OCH₂CH₃, –C(O)CH₃, –N(CH₃)₂, –C(O)NH₂ or –OC(O)CH₃. The groups, –C(O)CH₂CF₃, –CO₂H (carboxyl), –CO₂CH₃ (methylcarboxyl), –CO₂CH₂CH₃, –C(O)NH₂ (carbamoyl), and –CON(CH₃)₂, are non-limiting examples of substituted acyl groups.

\[ \text{[046]} \] The term “alkoxy” when used without the “substituted” modifier refers to the group –OR, in which R is an alkyl, as that term is defined above. Non-limiting examples of alkoxy
groups include: \(-\text{OCH}_3\), \(-\text{OCH}_2\text{CH}_3\), \(-\text{OCH}_2\text{CH}_2\text{CH}_3\), \(-\text{OCH(\text{CH}_3)}_2\), \(-\text{OCH(\text{CH}_2)}_2\), \(-\text{O}\)-cyclopentyl, and \(-\text{O}\)-cyclohexyl. The terms “alkenyloxy”, “alkynyloxy”, “aryloxy”, “aralkoxy”, “heteroaryloxy”, and “acyloxy”, when used without the “substituted” modifier, refers to groups, defined as \(-\text{OR}\), in which \(R\) is alkenyl, alkynyl, aryl, aralkyl, heteroaryl, and acyl, respectively. Similarly, the term “alkythio” when used without the “substituted” modifier refers to the group \(-\text{SR}\), in which \(R\) is an alkyl, as that term is defined above. When any of these terms is used with the “substituted” modifier one or more hydrogen atom has been independently replaced by \(-\text{OH}\), \(-\text{F}\), \(-\text{Cl}\), \(-\text{Br}\), \(-\text{I}\), \(-\text{NH}_2\), \(-\text{NO}_2\), \(-\text{CO}_2\text{H}\), \(-\text{CO}_2\text{CH}_3\), \(-\text{CN}\), \(-\text{SH}\), \(-\text{OCH}_3\), \(-\text{OCH}_2\text{CH}_3\), \(-\text{C(O)}\text{CH}_3\), \(-\text{N(\text{CH}_3)}_2\), \(-\text{C(O)}\text{NH}_2\) or \(-\text{OC(O)}\text{CH}_3\). The term “alcohol” corresponds to an alkane, as defined above, wherein at least one of the hydrogen atoms has been replaced with a hydroxy group.

[047] The term “alkylamino” when used without the “substituted” modifier refers to the group \(-\text{NHR}\), in which \(R\) is an alkyl, as that term is defined above. Non-limiting examples of alkylamino groups include: \(-\text{NHCH}_3\) and \(-\text{NHCH}_2\text{CH}_3\). The term “dialkylamino” when used without the “substituted” modifier refers to the group \(-\text{NRR}'\), in which \(R\) and \(R'\) can be the same or different alkyl groups, or \(R\) and \(R'\) can be taken together to represent an alkanediyl. Non-limiting examples of dialkylamino groups include: \(-\text{N(CH}_3)_2\), \(-\text{N(CH}_3)(\text{CH}_2\text{CH}_3)\), and \(N\)-pyrrolidinyl. The terms “alkoxyamino”, “alkenylamino”, “alkynylamino”, “arylamino”, “aralkylamino”, “heteroarylamino”, and “alkylsulfonamino” when used without the “substituted” modifier, refers to groups, defined as \(-\text{NHR}\), in which \(R\) is alkoxy, alkenyl, alkynyl, aryl, aralkyl, heteroaryl, and alkylsulfonyl, respectively. A non-limiting example of an arylamino group is \(-\text{NH}_3\text{H}_5\). The term “amido” (acylamino), when used without the “substituted” modifier, refers to the group \(-\text{NHR}\), in which \(R\) is acyl, as that term is defined above. A non-limiting example of an amido group is \(-\text{NHC(O)}\text{CH}_3\). The term “alkylimino” when used without the “substituted” modifier refers to the divalent group \(=\text{NR}\), in which \(R\) is an alkyl, as that term is defined above. When any of these terms is used with the “substituted” modifier one or more hydrogen atom has been independently replaced by \(-\text{OH}\), \(-\text{F}\), \(-\text{Cl}\), \(-\text{Br}\), \(-\text{I}\), \(-\text{NH}_2\), \(-\text{NO}_2\), \(-\text{CO}_2\text{H}\), \(-\text{CO}_2\text{CH}_3\), \(-\text{CN}\), \(-\text{SH}\), \(-\text{OCH}_3\), \(-\text{OCH}_2\text{CH}_3\), \(-\text{C(O)}\text{CH}_3\), \(-\text{N(\text{CH}_3)}_2\), \(-\text{C(O)}\text{NH}_2\) or \(-\text{OC(O)}\text{CH}_3\). The groups \(-\text{NHC(O)}\text{OCH}_3\) and \(-\text{NHC(O)}\text{NHCH}_3\) are non-limiting examples of substituted amido groups.

[048] The above definitions supersede any conflicting definition in any of the reference that is incorporated by reference herein. The fact that certain terms are defined, however, should not be considered as indicative that any term that is undefined is indefinite. Rather, all terms
used are believed to describe the invention in terms such that one of ordinary skill can appreciate the scope and practice the present invention.

[049] In the specification and in the claims, the terms "including" and "comprising" are open-ended terms and should be interpreted to mean "including, but not limited to. . . . "

These terms encompass the more restrictive terms “consisting essentially of” and “consisting of.”

[050] It must be noted that as used herein and in the appended claims, the singular forms "a", "an", and "the" include plural reference unless the context clearly dictates otherwise. As well, the terms "a" (or "an"), "one or more" and "at least one" can be used interchangeably herein. It is also to be noted that the terms "comprising", "including", “characterized by” and "having" can be used interchangeably.

[051] Unless defined otherwise, all technical and scientific terms used herein have the same meanings as commonly understood by one of ordinary skill in the art to which this invention belongs. All publications and patents specifically mentioned herein are incorporated by reference in their entirety for all purposes including describing and disclosing the chemicals, instruments, statistical analyses and methodologies which are reported in the publications which might be used in connection with the invention. All references cited in this specification are to be taken as indicative of the level of skill in the art. Nothing herein is to be construed as an admission that the invention is not entitled to antedate such disclosure by virtue of prior invention.

[052] The following paragraphs enumerated consecutively from 1 through 51 provide for various aspects of the embodiments described herein. In one embodiment, in a first paragraph (1), the present invention provides a method to produce hydrogen from formic acid comprising the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:

-20-
wherein $R_1$ and $R_2$, are each independently alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

$R_3$, and $R_4$, if present, are each independently alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

$R_5$ is a hydrogen atom or an alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, amino, hydroxyl, alkoxy or a substituted version of any of these groups;

each $Z$, independently, is CR$_6$, N or P;

$R_6$ is a hydrogen atom or an alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, amino, hydroxyl, alkoxy or a substituted version of any of these groups;

$T$ is a N, NR$_7$, CR$_8$, or CR$_9$R$_{10}$;

$R_7$, $R_8$, $R_9$ and $R_{10}$ are each independently a hydrogen, alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

$Q$ is P or N;

optionally, wherein $T$ and $Q$, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when $T$ and $Q$ form a 5 or 6 membered heterocyclic ring, $R_3$ and $R_4$ are not present; and

------ designates a single bond or a double bond.

[053] 2. The method of paragraph 1, wherein $T$ is NH and $Q$ is P.

[054] 3. The method of paragraph 2, wherein $R_1$, $R_2$, $R_3$ and $R_4$ are each an alkyl$_{(C\leq 12)}$.

[055] 4. The method of paragraph 3, wherein $R_1$, $R_2$, $R_3$ and $R_4$ are each a t-butyl group.

[056] 5. The method of paragraph 1, wherein $T$ is CH$_2$ and $Q$ is N.
[057] 6. The method of paragraph 5, wherein \( R_1, R_2, R_3 \) and \( R_4 \) are each an alkyl\(_{C_{12}}\).

[058] 7. The method of paragraph 6, wherein \( R_1 \), and \( R_2 \) are \( t \)-butyl group and \( R_3 \) and \( R_4 \) are ethyl groups.

[059] 8. The method of paragraph 1, wherein \( T \) is \( C \), \( Q \) is \( N \) and \( T \) and \( Q \) form

\[
\begin{align*}
\text{structure image} \\
\end{align*}
\]

wherein \( R_{11} \) and \( R_{12} \), each independently, are a hydrogen atom or alkyl\(_{C_{12}}\), aryl\(_{C_{12}}\), or a substituted version of any of these groups.

[060] 9. The method of paragraph 8, wherein \( R_{11} \) and \( R_{12} \) are both methyl groups.

[061] 10. The method of any of paragraphs 1 through 9, wherein the metal or metal ion is a Group 8 metal or metal ion.

[062] 11. The method of any of paragraphs 1 through 10, wherein the metal or metal ion is based on ruthenium.

[063] 12. The method of any of paragraphs 1 through 11, wherein the complex further comprises a second ligand, wherein the second ligand is a halide or a hydrogen atom.

[064] 13. The method of paragraph 12, wherein the halide is chloride.

[065] 14. The method of paragraphs 12 or 13, wherein the complex further comprises a third ligand, wherein the third ligand is carbon monoxide.

[066] 15. The method of any of paragraphs 1 through 14, wherein the method produces carbon dioxide.

[067] 16. The method of any of paragraphs 1 through 15, wherein substantially no carbon monoxide is produced.

[068] 17. The method of paragraph 16, wherein no carbon monoxide is produced.

[069] 18. The method of any of paragraphs 1 through 17, wherein a polar aprotic solvent is present, such as DMSO.

[070] 19. The method of any of paragraphs 1 through 18, wherein the catalyst has a turnover number from about 500 to about 500,000.

[071] 20. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (II):
wherein \( R_1 \) and \( R_2 \), are each independently alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), or a substituted version of any of these groups;

\( R_3 \), and \( R_4 \), if present, are each independently alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), or a substituted version of any of these groups;

\( R_5 \) is a hydrogen atom or an alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), or a substituted version of any of these groups;

each \( Z \), independently, is CR\(_6\), N or P;

\( R_6 \) is a hydrogen atom or an alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

\( M \) is a metal or metal ion that is a group 8 metal or metal ion;

\( L \) is a neutral or an anionic ligand;

\( n \) is 0, 1 or 2

\( X \) is a halide or a hydrogen atom;

\( T \) is a N, NR\(_7\), CR\(_8\), or CR\(_9\)R\(_{10}\);

\( R_7 \), \( R_8 \), \( R_9 \) and \( R_{10} \) are each independently a hydrogen, alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), or a substituted version of any of these groups;

\( Q \) is P or N;

optionally, wherein \( T \) and \( Q \), together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one alkyl\(_{12}\), aryl\(_{12}\), aralkyl\(_{12}\), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when \( T \) and \( Q \) form a 5 or 6 membered heterocyclic ring, \( R_3 \) and \( R_4 \) are not present; and

\( \text{---} \) designates a single bond or a double bond.

[072] The method of paragraph 20, wherein \( T \) is NH and \( Q \) is P.
[073] 22. The method of paragraph 21, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C₅H₁₂)-
[074] 23. The method of paragraph 22, wherein R₁, R₂, R₃ and R₄ are each a t-butyl group.
[075] 24. The method of paragraph 20, wherein T is CH₂ and Q is N.
[076] 25. The method of paragraph 24, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C₅H₁₂)-
[077] 26. The method of paragraph 25, wherein R₁, and R₂ are t-butyl group and R₃ and R₄ are ethyl groups.
[078] 27. The method of paragraph 20, wherein T is C, Q is N and T and Q form
\[
\begin{array}{c}
\text{N} \\
\text{R}_{11} \\
\text{R}_{12}
\end{array}
\]
wherein R₁₁ and R₁₂, each independently, are a hydrogen atom or alkyl(C₅H₁₂), aryl(C₅H₁₂), or a substituted version of any of these groups.
[079] 28. The method of paragraph 27, wherein R₁₁ and R₁₂ are both methyl groups.
[080] 29. The method of any of paragraphs 20 through 28, wherein the metal or metal ion is based on ruthenium.
[081] 30. The method of any of paragraphs 20 through 29, wherein X is chloride.
[083] 32. The method of any of paragraphs 20 through 30, wherein substantially no carbon monoxide is produced.
[084] 33. The method of paragraph 32, wherein no carbon monoxide is produced.
[085] 34. The method of any of paragraphs 20 through 33, wherein a polar aprotic solvent is present, such as DMSO.
[086] 35. The method of any of paragraphs 20 through 34, wherein the catalyst has a turnover number from about 500 to about 500,000.
[087] 36. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (III):
wherein R₁ and R₂, are each independently alkyl₁₂, ary₁₂, aralkyl₁₂, or a substituted version of any of these groups;

R₃, and R₄, if present, are each independently alkyl₁₂, ary₁₂, aralkyl₁₂, or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl₁₂, ary₁₂, aralkyl₁₂, or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl₁₂, ary₁₂, aralkyl₁₂, amino, hydroxyl, alkoxy or a substituted version of any of these groups;

T is a N, NR₇, CR₈, or CR₉R₁₀;

R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkyl₁₂, ary₁₂, aralkyl₁₂, or a substituted version of any of these groups;

Q is P or N;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2

X is a halide or a hydrogen atom; and

optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one alkyl₁₂, ary₁₂, aralkyl₁₂, or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R₃ and R₄ are not present; and

designates a single bond or a double bond.

[088] 37. The method of paragraph 36, wherein T is NH and Q is P.
[089] 38. The method of paragraph 37, wherein R\textsubscript{1}, R\textsubscript{2}, R\textsubscript{3} and R\textsubscript{4} are each an alkyl\textsubscript{(C\textsubscript{5}H\textsubscript{12})}.

[090] 39. The method of paragraph 38, wherein R\textsubscript{1}, R\textsubscript{2}, R\textsubscript{3} and R\textsubscript{4} are each a t-butyl group.

[091] 40. The method of paragraph 36, wherein T is CH\textsubscript{2} and Q is N.

[092] 41. The method of paragraph 40, wherein R\textsubscript{1}, R\textsubscript{2}, R\textsubscript{3} and R\textsubscript{4} are each an alkyl\textsubscript{(C\textsubscript{5}H\textsubscript{12})}.

[093] 42. The method of paragraph 41, wherein R\textsubscript{1} and R\textsubscript{2} are t-butyl group and R\textsubscript{3} and R\textsubscript{4} are ethyl groups.

[094] 43. The method of paragraph 36, wherein T is C, Q is N and T and Q form

![Chemical structure](image)

, wherein R\textsubscript{11} and R\textsubscript{12}, each independently, are a hydrogen atom or alkyl\textsubscript{(C\textsubscript{5}H\textsubscript{12})}, aryl\textsubscript{(C\textsubscript{5}H\textsubscript{12})}, aralkyl\textsubscript{(C\textsubscript{5}H\textsubscript{12})}, or a substituted version of any of these groups.

[095] 44. The method of paragraph 43, wherein R\textsubscript{11} and R\textsubscript{12} are both methyl groups.

[096] 45. The method of any of paragraphs 36 through 44, wherein the metal or metal ion is based on ruthenium.

[097] 46. The method of any of paragraphs 36 through 45, wherein X is chloride.

[098] 47. The method of any of paragraphs 36 through 46, wherein the method produces carbon dioxide.

[099] 48. The method of any of paragraphs 36 through 46, wherein substantially no carbon monoxide is produced.

[0100] 49. The method of paragraph 48, wherein no carbon monoxide is produced.

[0101] 50. The method of any of paragraphs 36 through 49, wherein a polar aprotic solvent is present, such as DMSO.

[0102] 51. The method of any of paragraphs 36 through 50, wherein the catalyst has a turnover number from about 500 to about 500,000.

[0103] The following paragraphs enumerated consecutively from 1 through 29 provide for aspects of the embodiments described herein. In one embodiment, in a first paragraph (1), the present invention provides a composition comprising a compound of formula (IV):
wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each independently alkyl\( (\text{C}_{12})_n \), aryl\( (\text{C}_{12})_n \), aralkyl\( (\text{C}_{12})_n \), or a substituted version of any of these groups;

\( R_5 \) is a hydrogen atom or an alkyl\( (\text{C}_{12})_n \), aryl\( (\text{C}_{12})_n \), aralkyl\( (\text{C}_{12})_n \), or a substituted version of any of these groups;

each \( Z \), independently, is CR\( _6 \), N or P;

\( R_6 \) is a hydrogen atom or an alkyl\( (\text{C}_{12})_n \), aryl\( (\text{C}_{12})_n \), aralkyl\( (\text{C}_{12})_n \), amino, hydroxyl, alkoxyl or a substituted version of any of these groups; and

provided that when \( R^1, R^2, R^3 \) and \( R^4 \) are t-butyl groups, \( R_5 \) is not a hydrogen atom and each \( Z \) is not CH, when \( R^1, R^2, R^3 \) and \( R^4 \) are isopropyl groups, \( R_5 \) is not a phenyl group and each \( Z \) is not N and when \( R_1, R_2, R_3, \) and \( R_4 \) are phenyl, \( R_5 \) is not a hydrogen atom and each \( Z \) is not CH.

2. The composition of paragraph 1, wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each isopropyl groups, each \( Z \) is CH and \( R_5 \) is a hydrogen atom.

3. A composition comprising a compound of formula (V):

wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each independently alkyl\( (\text{C}_{12})_n \), aryl\( (\text{C}_{12})_n \), aralkyl\( (\text{C}_{12})_n \), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl(C₈H₁₂), aryl(C₈H₁₂), aralkyl(C₈H₁₂), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₈H₁₂), aryl(C₈H₁₂), aralkyl(C₈H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2;

X is a halide or a hydrogen atom; and

provided that when R¹, R², R³ and R⁴ are t-butyl groups, R₅ is not a hydrogen atom and each Z is not CH and when R¹, R², R³ and R⁴ are isopropyl groups, R₅ is not a phenyl group and each Z is not N.

[0106] 4. The composition of paragraph 3, wherein R₁, R₂, R₃, and R₄ are each isopropyl groups, each Z is CH and R₅ is a hydrogen atom.

[0107] 5. A composition comprising a compound of formula (VI):

![Compound VI](image)

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₈H₁₂), aryl(C₈H₁₂), aralkyl(C₈H₁₂), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C₈H₁₂), aryl(C₈H₁₂), aralkyl(C₈H₁₂), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₈H₁₂), aryl(C₈H₁₂), aralkyl(C₈H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2;
X is a halide or a hydrogen atom; and
provided that when \( R^1, R^2, R^3 \) and \( R^4 \) are t-butyl groups, \( R_5 \) is not a hydrogen atom, each \( Z \) is
not CH and M is not Ru, and when \( R^1, R^2, R^3 \) and \( R^4 \) are isopropyl groups, \( R_5 \) is not a phenyl
group, each \( Z \) is not N and M is not Ir.

[0108] 6. The composition of paragraph 5, wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each isopropyl
groups, each \( Z \) is CH and \( R_5 \) is a hydrogen atom.

[0109] 7. A complex comprising a ligand and a metal or metal ion, wherein the ligand is
a compound according to paragraph 1, or a deprotonated version thereof, and the ligand is
associated with the metal or metal ion, provided that \( R^1, R^2, R^3 \) and \( R^4 \) are t-butyl groups, \( R_5 \)
is not a hydrogen atom, each \( Z \) is not CH and M is not Ru, and when \( R^1, R^2, R^3 \) and \( R^4 \) are
isopropyl groups, \( R_5 \) is not a phenyl group, each \( Z \) is not N and M is not Ir.

[0110] 8. The complex of paragraph 7, wherein the metal or metal ion is a group 8 metal
or metal ion.

[0111] 9. The complex of paragraph 8, wherein the metal or metal ion is based on
ruthenium.

[0112] 10. The complex according to paragraph 7, wherein the complex further
comprises a second ligand, wherein the second ligand is chloride.

[0113] 11. The complex according to paragraph 10, wherein the complex further
comprises a third ligand, wherein the third ligand is carbon monoxide.

[0114] 12. A method to produce hydrogen from formic acid comprising the step of
contacting formic acid with a compound of formula (V):

\[
\begin{align*}
\text{HN} & \quad \text{NH} \\
\text{R_1} & \quad \text{R_2} \\
\text{X} & \quad \text{L_n} \\
\text{R_3} & \quad \text{R_4} \\
\text{Z} & \quad \text{Z} \\
\text{R_5} & \quad \text{(V)}
\end{align*}
\]

wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each independently alkyl\(_{(\text{C}_1\text{S}_2)}\), aryI\(_{(\text{C}_1\text{S}_2)}\), aralkyl\(_{(\text{C}_1\text{S}_2)}\), or a
substituted version of any of these groups;

\( R_5 \) is a hydrogen atom or an alkyl\(_{(\text{C}_1\text{S}_2)}\), aryI\(_{(\text{C}_1\text{S}_2)}\), aralkyl\(_{(\text{C}_1\text{S}_2)}\), or a substituted version of any
of these groups;
each Z, independently, is CR₆, N or P;
R₅ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aroalkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;
M is a metal or metal ion that is a group 8 metal or metal ion;
L is a neutral or an anionic ligand;
n is 0, 1 or 2; and
X is a halide or a hydrogen atom.

[0116] 14. The method of paragraph 12 or 13, wherein substantially no carbon monoxide is produced.
[0117] 15. The method of paragraph 12 or 13, wherein no carbon monoxide is produced.
[0118] 16. The method of any of paragraphs 12 through 15, wherein a polar aprotic solvent is present, such as DMSO.
[0119] 17. The method of any of paragraphs 12 through 15, wherein the catalyst has a turnover number from about 500 to about 500,000.
[0120] 18. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (VI):

![Image of molecular structure]

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₅H₁₂), aryl(C₅H₁₂), aroalkyl(C₅H₁₂), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aroalkyl(C₅H₁₂), or a substituted version of any of these groups;
each Z, independently, is CR₆, N or P;
R₆ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aroalkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;
M is a metal or metal ion that is a group 8 metal or metal ion;
L is a neutral or an anionic ligand;
n is 0, 1 or 2; and
X is a halide or a hydrogen atom.

[0121] 19. The method of paragraph 18, wherein the method produces carbon dioxide.

[0122] 20. The method of paragraph 18 or 19, wherein substantially no carbon monoxide is produced.

[0123] 21. The method of paragraph 18 or 19, wherein no carbon monoxide is produced.

[0124] 22. The method of any of paragraphs 18 through 21, wherein a polar aprotic solvent is present, such as DMSO.

[0125] 23. The method of any of paragraphs 18 through 21, wherein the catalyst has a turnover number from about 500 to about 500,000.

[0126] 24. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (IV), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (IV) comprises:

\[
\begin{align*}
\text{H} & \quad \text{N} \\
\text{Z} & \quad \text{Z} \\
\text{Z} & \quad \text{Z} \\
\text{P} & \quad \text{R}_1 \\
\text{R}_2 & \quad \text{R}_3 \\
\text{R}_4 & \quad \text{R}_5
\end{align*}
\]

wherein \( R_1, R_2, R_3, \) and \( R_4 \) are each independently alkyl\( (C_{\leq 12}) \), aryl\( (C_{\leq 12}) \), aralkyl\( (C_{\leq 12}) \), or a substituted version of any of these groups;

\( R_5 \) is a hydrogen atom or an alkyl\( (C_{\leq 12}) \), aryl\( (C_{\leq 12}) \), aralkyl\( (C_{\leq 12}) \), or a substituted version of any of these groups;

each \( Z \), independently, is \( CR_6, N \) or \( P \); and

\( R_6 \) is a hydrogen atom or an alkyl\( (C_{\leq 12}) \), aryl\( (C_{\leq 12}) \), aralkyl\( (C_{\leq 12}) \), amino, hydroxyl, alkoxy or a substituted version of any of these groups.

[0127] 25. The method of paragraph 24, wherein the method produces carbon dioxide.

[0128] 26. The method of paragraph 24 or 25, wherein substantially no carbon monoxide is produced.

[0129] 27. The method of paragraph 24 or 25, wherein no carbon monoxide is produced.
[0130] 28. The method of any of paragraphs 24 through 27, wherein a polar aprotic solvent is present, such as DMSO.

[0131] 29. The method of any of paragraphs 25 through 27, wherein the catalyst has a turnover number from about 500 to about 500,000

[0132] In another aspect, method to produce formic acid or a formate is provided comprising the step of contacting carbon dioxide and hydrogen under increased pressure relative to atmospheric pressure, with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:

![Chemical Structure](image)

wherein $R_1$ and $R_2$, are each independently alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$, aralkyl$_{(C_{≤12})}$ or a substituted version of any of these groups;

$R_3$, and $R_4$, if present, are each independently alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$, aralkyl$_{(C_{≤12})}$ or a substituted version of any of these groups;

$R_5$ is a hydrogen atom or an alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$, aralkyl$_{(C_{≤12})}$, amino, hydroxyl, alkoxyl or a substituted version of any of these groups;

each $Z$, independently, is CR$_6$, N or P;

$R_6$ is a hydrogen atom or an alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$, aralkyl$_{(C_{≤12})}$, amino, hydroxyl, alkoxyl or a substituted version of any of these groups;

$T$ is a N, NR$_7$, CR$_8$, or CR$_3R_{10}$;

$R_7$, $R_8$, $R_9$ and $R_{10}$ are each independently a hydrogen, alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$, aralkyl$_{(C_{≤12})}$, or a substituted version of any of these groups;

$Q$ is P or N;

optionally, wherein $T$ and $Q$, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl$_{(C_{≤12})}$, aryl$_{(C_{≤12})}$.
aralkyl\(_{(C_{12})}\), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R\(_3\) and R\(_4\) are not present; and

--- designates a single bond or a double bond, such that a formate or formic acid is produced.

[0133] In still another aspect, a method is provided to produce formic acid or a formate, comprising the step of contacting carbon dioxide and hydrogen under increased pressure relative to atmospheric pressure with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (IV), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (IV) comprises:

\[
\begin{array}{c}
\text{Z} \\
\text{N} \\
\text{NH} \\
\text{R}^1 \text{P} \text{R}^2 \\
\text{R}^3 \text{P} \text{R}^4 \\
\text{R}^5
\end{array}
\]

wherein R\(_1\), R\(_2\), R\(_3\), and R\(_4\) are each independently alkyl\(_{(C_{12})}\), aryl\(_{(C_{12})}\), aralkyl\(_{(C_{12})}\), or a substituted version of any of these groups;

R\(_5\) is a hydrogen atom or an alkyl\(_{(C_{12})}\), aryl\(_{(C_{12})}\), aralkyl\(_{(C_{12})}\), or a substituted version of any of these groups;

each Z, independently, is CR\(_6\), N or P; and

R\(_6\) is a hydrogen atom or an alkyl\(_{(C_{12})}\), aryl\(_{(C_{12})}\), aralkyl\(_{(C_{12})}\), amino, hydroxyl, alkoxyl or a substituted version of any of these groups, such that formic acid or a formate is produced.

[0134] The invention will be further described with reference to the following non-limiting Examples. It will be apparent to those skilled in the art that many changes can be made in the embodiments described without departing from the scope of the present invention. Thus the scope of the present invention should not be limited to the embodiments described in this application, but only by embodiments described by the language of the claims and the equivalents of those embodiments. Unless otherwise indicated, all percentages are by weight.
Examples

[0136] Example 1 provides catalyzed production of hydrogen from formic acid. The reaction was conducted under air in a reaction flask. TON was calculated by the highest volume of hydrogen/formic acid consumed per weight of catalyst.

Table 1: Ru(II) pincer complexes catalyzed production of H₂ from formic acid.[a]

[a] Catalyst C3 (1.0 x 10⁻³ mmol) and KOH (1.0 mmol) in a mixture of 5.0 mL of toluene and 1.0 mL of H₂O.  
[b] Catalyst C3 (1.0 x 10⁻³ mmol) and KOH (1.0 mmol) in a mixture of 1.0 mL of toluene and 5.0 mL of H₂O.  
[c] P_{H₂}:P_{CO₂} = 1:1.  
[c] Yields of HCOOK were calculated based on ¹H NMR analysis using sodium 3-(trimethylsilyl)-1-propanesulfonate as an internal standard.

[0137] Not to be limited by theory, it is believed that the reaction proceeds by an increase in pressure in a system wherein carbon dioxide and or hydrogen are present. The pressure can be greater than 1 psi, particularly from about 10 to 500 psi, more particularly from about 100 to about 300 psi, and even more particularly from about 120 to about 240 psi. Inclusion of an organic or inorganic base, such as an amine or a metal hydroxide, such as potassium hydroxide, in the reaction mixture also benefits the conversion.

[0138] Although the present invention has been described with reference to preferred embodiments, persons skilled in the art will recognize that changes may be made in form and detail without departing from the spirit and scope of the invention. All references cited throughout the specification, including those in the background, are incorporated herein in their entirety. Those skilled in the art will recognize, or be able to ascertain, using no more than routine experimentation, many equivalents to specific embodiments of the invention described specifically herein. Such equivalents are intended to be encompassed in the scope of the following claims.
REFERENCES

The following references to the extent that they provide exemplary procedural or other details supplementary to those set forth herein, are specifically incorporated herein by reference.

CLAIMS

1. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:

wherein R₁ and R₂, are each independently alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;

R₃, and R₄, if present, are each independently alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

T is a N, NR₆, CR₆, or CR₆R₆R₆;

R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups;

Q is P or N;

optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl₁(C≤12), aryl₁(C≤12), aralkyl₁(C≤12), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R₃ and R₄ are not present; and

----- designates a single bond or a double bond.
2. The method of claim 1, wherein T is NH and Q is P.

3. The method of claim 2, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C₆H₁₂)-

4. The method of claim 3, wherein R₁, R₂, R₃ and R₄ are each a t-butyl group.

5. The method of claim 1, wherein T is CH₂ and Q is N.

6. The method of claim 5, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C₆H₁₂)-

7. The method of claim 6, wherein R₁, and R₂ are t-butyl group and R₃ and R₄ are ethyl groups.

8. The method of claim 1, wherein T is C, Q is N and T and Q form

   ![Chemical Structure](image)

   wherein R₁₁ and R₁₂, each independently, are a hydrogen atom or alkyl(C₆H₁₂), aryl(C₆H₁₂), aroyl(C₆H₁₂), or a substituted version of any of these groups.

9. The method of claim 8, wherein R₁₁ and R₁₂ are both methyl groups.

10. The method of any of claims 1 through 9, wherein the metal or metal ion is a Group 8 metal or metal ion.

11. The method of any of claims 1 through 10, wherein the metal or metal ion is based on ruthenium.

12. The method of any of claims 1 through 11, wherein the complex further comprises a second ligand, wherein the second ligand is a halide or a hydrogen atom.

13. The method of claim 12, wherein the halide is chloride.
14. The method of claims 12 or 13, wherein the complex further comprises a third ligand, wherein the third ligand is carbon monoxide.

15. The method of any of claims 1 through 14, wherein the method produces carbon dioxide.

16. The method of any of claims 1 through 15, wherein substantially no carbon monoxide is produced.

17. The method of claim 16, wherein no carbon monoxide is produced.

18. The method of any of claims 1 through 17, wherein a polar aprotic solvent is present, such as DMSO.

19. The method of any of claims 1 through 18, wherein the catalyst has a turnover number from about 500 to about 500,000.

20. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (II):

![Chemical structure](attachment:image.png)

wherein R₁ and R₂, are each independently alkyl_{(C≤12)}, aryl_{(C≤12)}, aralkyl_{(C≤12)}, or a substituted version of any of these groups;

R₃, and R₄, if present, are each independently alkyl_{(C≤12)}, aryl_{(C≤12)}, aralkyl_{(C≤12)}, or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl_{(C≤12)}, aryl_{(C≤12)}, aralkyl_{(C≤12)}, or a substituted version of any of these groups;
each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkylₐ(C₈₁₂), arylₐ(C₈₁₂), aralkylₐ(C₈₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2

X is a halide or a hydrogen atom;

T is a N, NR₇, CR₈, or CR₉R₁₀;

R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkylₐ(C₈₁₂), arylₐ(C₈₁₂), aralkylₐ(C₈₁₂), or a substituted version of any of these groups;

Q is P or N;

optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one alkylₐ(C₈₁₂), arylₐ(C₈₁₂), aralkylₐ(C₈₁₂), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R₃ and R₄ are not present; and

----- designates a single bond or a double bond.

21. The method of claim 20, wherein T is NH and Q is P.

22. The method of claim 21, wherein R₁, R₂, R₃ and R₄ are each an alkylₐ(C₈₁₂).

23. The method of claim 22, wherein R₁, R₂, R₃ and R₄ are each a t-butyl group.

24. The method of claim 20, wherein T is CH₂ and Q is N.

25. The method of claim 24, wherein R₁, R₂, R₃ and R₄ are each an alkylₐ(C₈₁₂).

26. The method of claim 25, wherein R₁ and R₂ are t-butyl group and R₃ and R₄ are ethyl groups.
27. The method of claim 20, wherein T is C, Q is N and T and Q form

![Chemical Structure](image)

wherein R_{11} and R_{12}, each independently, are a hydrogen atom or alkyl_{(C\leq12)}, aryl_{(C\leq12)}, aralkyl_{(C\leq12)}, or a substituted version of any of these groups.

28. The method of claim 27, wherein R_{11} and R_{12} are both methyl groups.

29. The method of any of claims 20 through 28, wherein the metal or metal ion is based on ruthenium.

30. The method of any of claims 20 through 29, wherein X is chloride.

31. The method of any of claims 20 through 30, wherein the method produces carbon dioxide.

32. The method of any of claims 20 through 30, wherein substantially no carbon monoxide is produced.

33. The method of claim 32, wherein no carbon monoxide is produced.

34. The method of any of claims 20 through 33, wherein a polar aprotic solvent is present, such as DMSO.

35. The method of any of claims 20 through 34, wherein the catalyst has a turnover number from about 500 to about 500,000.

36. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (III):
wherein $R_1$ and $R_2$, are each independently alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

$R_3$, and $R_4$, if present, are each independently alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

$R_5$ is a hydrogen atom or an alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

each $Z$, independently, is CR$_6$, N or P;

$R_6$ is a hydrogen atom or an alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, amino, hydroxyl, alkoxy or a substituted version of any of these groups;

$T$ is a N, NR$_7$, CR$_8$, or CR$_9$R$_{10}$;

$R_7$, $R_8$, $R_9$ and $R_{10}$ are each independently a hydrogen, alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups;

Q is P or N;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2

X is a halide or a hydrogen atom; and

optionally, wherein $T$ and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one alkyl$_{(C\leq 12)}$, aryl$_{(C\leq 12)}$, aralkyl$_{(C\leq 12)}$, or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when $T$ and Q form a 5 or 6 membered heterocyclic ring, $R_3$ and $R_4$ are not present; and

====== designates a single bond or a double bond.

37. The method of claim 36, wherein $T$ is NH and Q is P.
38. The method of claim 37, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C≤12).

39. The method of claim 38, wherein R₁, R₂, R₃ and R₄ are each a t-butyl group.

40. The method of claim 36, wherein T is CH₂ and Q is N.

41. The method of claim 40, wherein R₁, R₂, R₃ and R₄ are each an alkyl(C≤12).

42. The method of claim 41, wherein R₁, and R₂ are t-butyl group and R₃ and R₄ are ethyl groups.

43. The method of claim 36, wherein T is C, Q is N and T and Q form

\[
\begin{array}{c}
\text{N} \\
\text{O} \\
R_{12} \\
R_{11}
\end{array}
\]

, wherein R₁₁ and R₁₂, each independently, are a hydrogen atom or alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), or a substituted version of any of these groups.

44. The method of claim 43, wherein R₁₁ and R₁₂ are both methyl groups.

45. The method of any of claims 36 through 44, wherein the metal or metal ion is based on ruthenium.

46. The method of any of claims 36 through 45, wherein X is chloride.

47. The method of any of claims 36 through 46, wherein the method produces carbon dioxide.

48. The method of any of claims 36 through 46, wherein substantially no carbon monoxide is produced.

49. The method of claim 48, wherein no carbon monoxide is produced.
50. The method of any of claims 36 through 49, wherein a polar aprotic solvent is present, such as DMSO.

51. The method of any of claims 36 through 50, wherein the catalyst has a turnover number from about 500 to about 500,000.

52. A composition comprising a compound of formula (IV):

![Chemical Structure](image)

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₆H₁₂), aryl(C₆H₁₂), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C₆H₁₂), aryl(C₆H₁₂), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₆H₁₂), aryl(C₆H₁₂), or a substituted version of any of these groups; and

provided that when R¹, R², R³ and R⁴ are t-butyl groups, R₅ is not a hydrogen atom and each Z is not CH, when R¹, R², R³ and R⁴ are isopropyl groups, R₅ is not a phenyl group and each Z is not N and when R₁, R₂, R₃, and R₄ are phenyl, R₅ is not a hydrogen atom and each Z is not CH.

53. The composition of claim 51, wherein R₁, R₂, R₃, and R₄ are each isopropyl groups, each Z is CH and R₅ is a hydrogen atom.

54. A composition comprising a compound of formula (V):
wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2;

X is a halide or a hydrogen atom; and

provided that when R¹, R², R³ and R⁴ are t-butyl groups, R₅ is not a hydrogen atom and each Z is not CH and when R¹, R², R³ and R⁴ are isopropyl groups, R₅ is not a phenyl group and each Z is not N.

55. The composition of claim 54, wherein R₁, R₂, R₃, and R₄ are each isopropyl groups, each Z is CH and R₅ is a hydrogen atom.

56. A composition comprising a compound of formula (VI):
wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2;

X is a halide or a hydrogen atom; and

provided that when R¹, R², R³ and R⁴ are t-butyl groups, R₅ is not a hydrogen atom, each Z is not CH and M is not Ru, and when R¹, R², R³ and R⁴ are isopropyl groups, R₅ is not a phenyl group, each Z is not N and M is not Ir.

57. The composition of claim 56, wherein R₁, R₂, R₃, and R₄ are each isopropyl groups, each Z is CH and R₅ is a hydrogen atom.

58. A complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to claim 52, or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, provided that R¹, R², R³ and R⁴ are t-butyl groups, R₅ is not a hydrogen atom, each Z is not CH and M is not Ru, and when R¹, R², R³ and R⁴ are isopropyl groups, R₅ is not a phenyl group, each Z is not N and M is not Ir.
59. The complex of claim 58, wherein the metal or metal ion is a group 8 metal or metal ion.

60. The complex of claim 59, wherein the metal or metal ion is based on ruthenium.

61. The complex according to claim 58, wherein the complex further comprises a second ligand, wherein the second ligand is chloride.

62. The complex according to claim 61, wherein the complex further comprises a third ligand, wherein the third ligand is carbon monoxide.

63. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (V):

![Chemical Structure](image)

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₈H₁₈), aryl(C₆H₅), aralkyl(C₆H₅C₈H₁₈), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C₈H₁₈), aryl(C₆H₅), aralkyl(C₆H₅C₈H₁₈), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₈H₁₈), aryl(C₆H₅), aralkyl(C₆H₅C₈H₁₈), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;

n is 0, 1 or 2; and

X is a halide or a hydrogen atom.
64. The method of claim 63, wherein the method produces carbon dioxide.

65. The method of claim 63 or 64, wherein substantially no carbon monoxide is produced.

66. The method of claim 63 or 64, wherein no carbon monoxide is produced.

67. The method of claim 66, wherein a polar aprotic solvent is present, such as DMSO.

68. The method of claim 66, wherein the catalyst has a turnover number from about 500 to about 500,000.

69. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a compound of formula (VI):

![Diagram](VI)

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), or a substituted version of any of these groups;

R₅ is a hydrogen atom or an alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C≤12), aryl(C≤12), aralkyl(C≤12), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

M is a metal or metal ion that is a group 8 metal or metal ion;

L is a neutral or an anionic ligand;
n is 0, 1 or 2; and
X is a halide or a hydrogen atom.

70. The method of claim 69, wherein the method produces carbon dioxide.

71. The method of claim 69 or 70, wherein substantially no carbon monoxide is produced.

72. The method of claim 69 or 70, wherein no carbon monoxide is produced.

73. The method of claim 72, wherein a polar aprotic solvent is present, such as DMSO.

74. The method of claim 72, wherein the catalyst has a turnover number from about 500 to about 500,000.

75. A method to produce hydrogen from formic acid comprising the step of contacting formic acid with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (IV), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (IV) comprises:

\[
\begin{array}{c}
\text{R}^1 \text{P} & \text{R}^2 \text{P} & \text{R}^3 \text{P} & \text{R}^4 \text{P} \\
\text{NH} & \text{NH} & \text{Z} & \text{Z} \\
\end{array}
\]

\[
(IV)
\]

wherein \(R_1, R_2, R_3, \) and \(R_4\) are each independently alkyl\((\text{C}_1\text{C}_{12})\), aryl\((\text{C}_1\text{C}_{12})\), aralkyl\((\text{C}_1\text{C}_{12})\), or a substituted version of any of these groups;

\(R_5\) is a hydrogen atom or an alkyl\((\text{C}_1\text{C}_{12})\), aryl\((\text{C}_1\text{C}_{12})\), aralkyl\((\text{C}_1\text{C}_{12})\), or a substituted version of any of these groups;

each \(Z\), independently, is CR\(_6\), N or P; and
R₆ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups.

76. The method of claim 75, wherein the method produces carbon dioxide.

77. The method of claim 75 or 76, wherein substantially no carbon monoxide is produced.

78. The method of claim 75 or 76, wherein no carbon monoxide is produced.

79. The method of claim 78, wherein a polar aprotic solvent is present, such as DMSO.

80. The method of claim 78, wherein the catalyst has a turnover number from about 500 to about 500,000.

81. A method to produce formic acid or a formate, comprising the step of contacting carbon dioxide and hydrogen under increased pressure relative to atmospheric pressure, with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (I), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (I) comprises:

\[
\begin{align*}
\text{R}_1 & \quad \text{P} \quad \text{R}_2 \\
\text{Z} & \quad \text{N} \quad \text{Z} \\
\text{N} & \quad \text{T} \quad \text{O} \\
\text{R}_3 & \quad \text{R}_4
\end{align*}
\]

wherein R₁ and R₂, are each independently alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;

R₃, and R₄, if present, are each independently alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P;

R₆ is a hydrogen atom or an alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), amino, hydroxyl, alkoxy or a substituted version of any of these groups;

T is a N, NR₇, CR₈, or CR₉R₁₀;

R₇, R₈, R₉ and R₁₀ are each independently a hydrogen, alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;

Q is P or N;

optionally, wherein T and Q, together, form a 5 or 6 membered heterocyclic ring; wherein the heterocyclic ring can optionally be substituted with one or more heteroatoms and or one or more sites of the heterocyclic ring are substituted with one or more alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups, and optionally wherein the heterocyclic ring can have a fused ring attached thereto, provided when T and Q form a 5 or 6 membered heterocyclic ring, R₃ and R₄ are not present; and

----- designates a single bond or a double bond, such that a formate or formic acid is produced.

82. A method to produce formic acid or a formate, comprising the step of contacting carbon dioxide and hydrogen under increased pressure relative to atmospheric pressure with a complex comprising a ligand and a metal or metal ion, wherein the ligand is a compound according to formula (IV), or a deprotonated version thereof, and the ligand is associated with the metal or metal ion, wherein formula (IV) comprises:

![Diagram](image)

wherein R₁, R₂, R₃, and R₄ are each independently alkyl(C₅H₁₂), aryl(C₅H₁₂), aralkyl(C₅H₁₂), or a substituted version of any of these groups;
R₅ is a hydrogen atom or an alkyl(C₅≤12), aryl(C₅≤12), aralkyl(C₅≤12), or a substituted version of any of these groups;

each Z, independently, is CR₆, N or P; and

R₆ is a hydrogen atom or an alkyl(C₅≤12), aryl(C₅≤12), aralkyl(C₅≤12), amino, hydroxyl, alkoxy or a substituted version of any of these groups, such that formic acid or a formate is produced.
INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

INV. B01J3/18 C01B3/22 C07C51/00 C07C51/41 C07C53/02
C07C53/06 C07F15/00

ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
B01J C01B C07C C07F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:

**"A"** document defining the general state of the art which is not considered to be of particular relevance

**"E"** earlier application or patent but published on or after the international filing date

**"L"** document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

**"O"** document referring to an oral disclosure, use, exhibition or other means

**"P"** document published prior to the international filing date but later than the priority date claimed

**"T"** later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

**"X"** document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

**"Y"** document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

**"Z"** document member of the same patent family
