## Concept

Locating an institution's DOI minting capacity within a specific repository software often limits the ability to quickly adapt the service to changing local needs. The availability of a stable DSpace REST API gave us the opportunity to develop a custom-built DOI minter for DataCite that can more easily grow and change with our services.

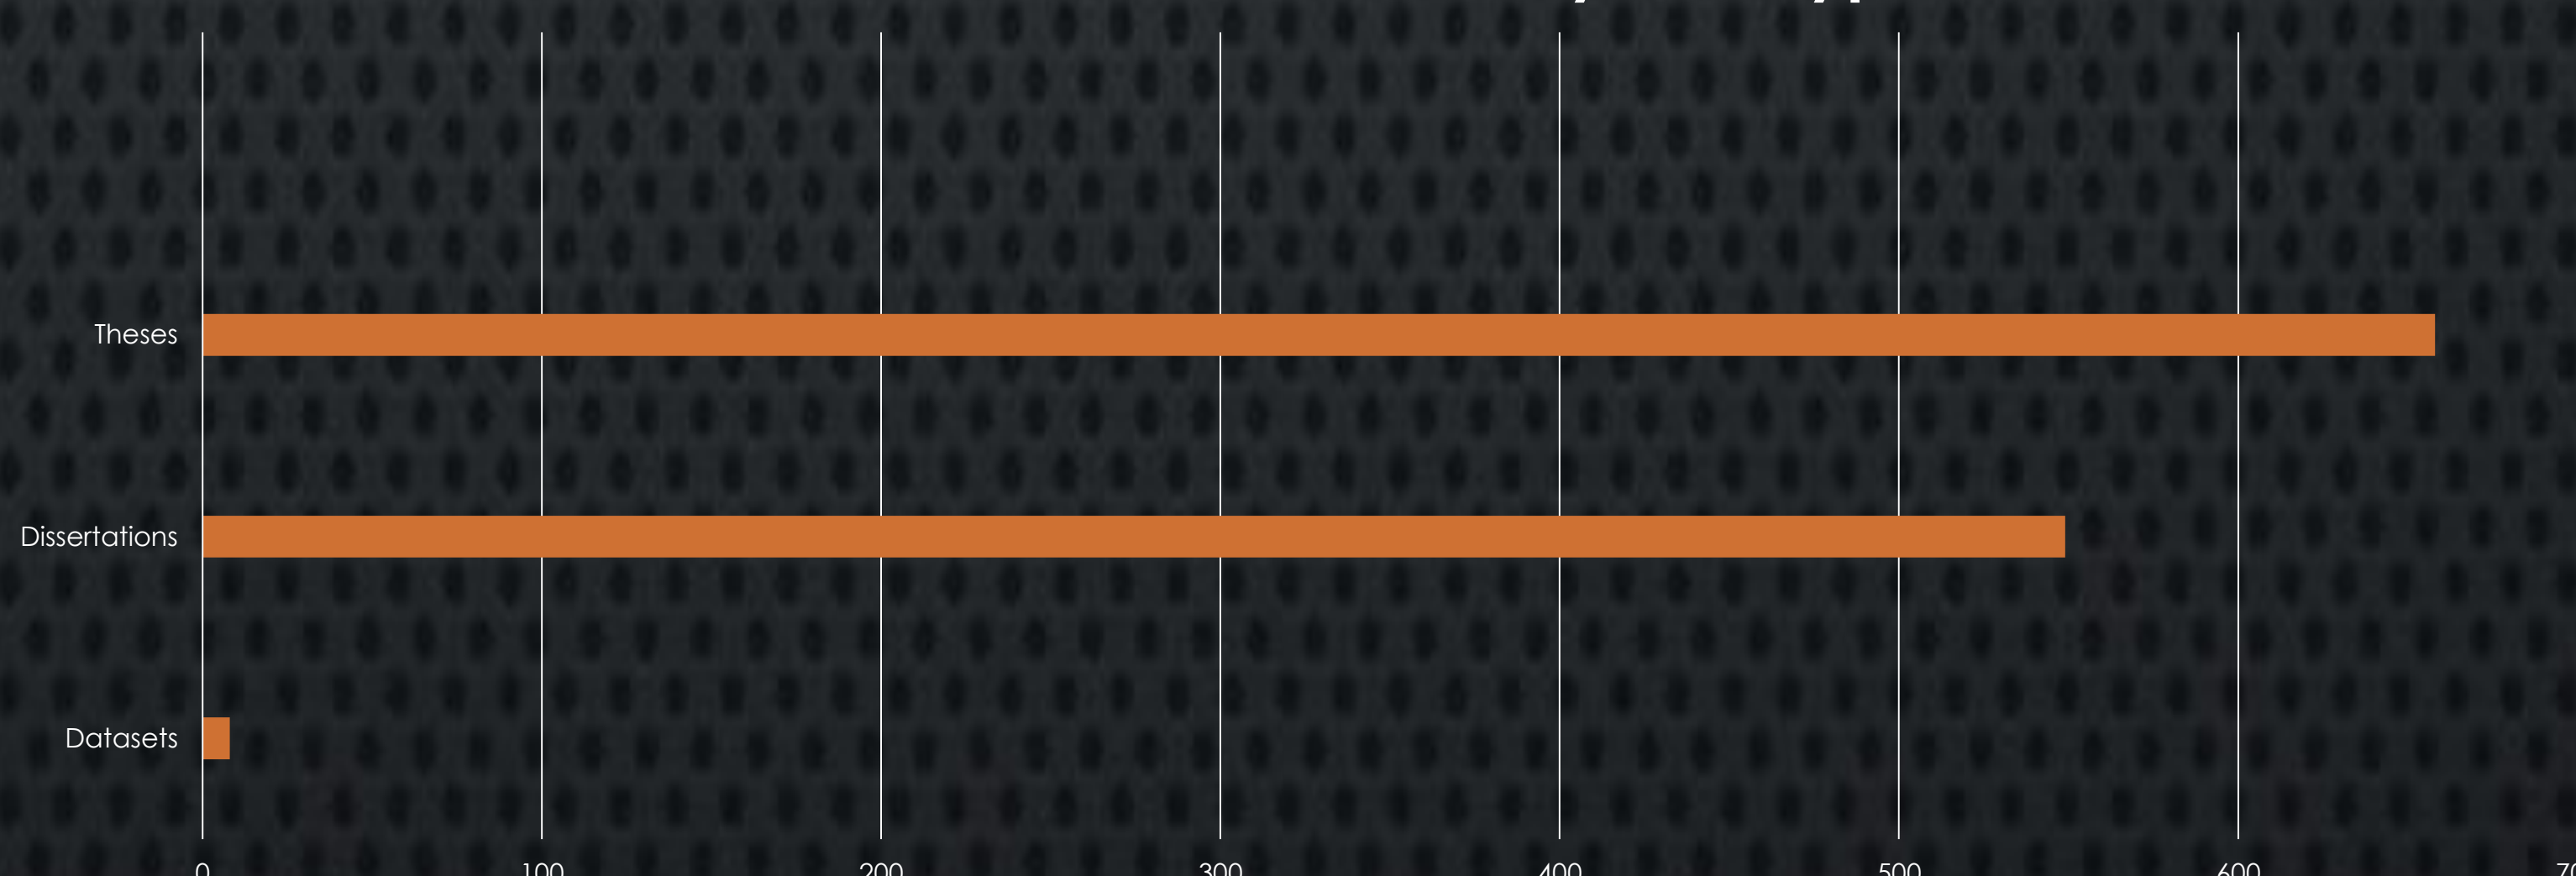

## Project

### The tool features:

- Inclusion of ORCID IDs in metadata transferred from DSpace to DataCite
- Flexible minting of DOIs based on DOI request field in item level metadata.
- Notification emails to users.

Numbers of DOIs minted, by item type

## Next Steps:

- Mint DOIs for resources released on other KAUST websites, not only the repository.
- Increase support for information about relationships between items to be sent to DataCite.
